

Wi-Fi Goes to Town: Rapid Picocell Switching for Rapid Transit

Kyle Jamieson
Princeton University
University College London

London Underground

Tokyo Metro

Princeton "Dinky"

Google/Waymo

1. More people, more mobility
2. More data consumption

*How to scale up bits/second/Hertz
network delivers, roadside and trackside?*

Two observations

1. Falling analog and digital logic cost →
 - ESP8266 \$5 Wi-Fi system-on-chip today (tomorrow, ¢?)

Two observations

1. Falling analog and digital logic cost →
 - ESP8266 \$5 Wi-Fi system-on-chip today (tomorrow, ¢?)
2. **Smaller wireless cells yield greater capacity**

Wi-Fi Goes to Town

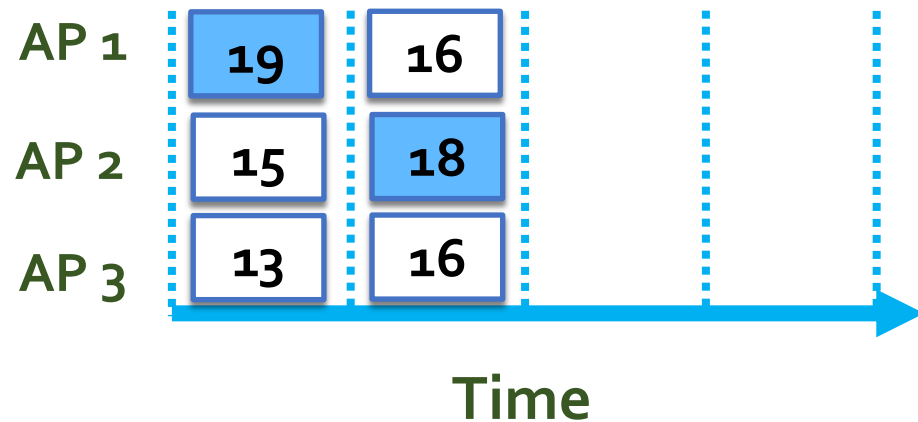

An array of cheap access points serving mobiles

Uplink: Can leverage link diversity

- Controller **de-duplicates** uplink packets

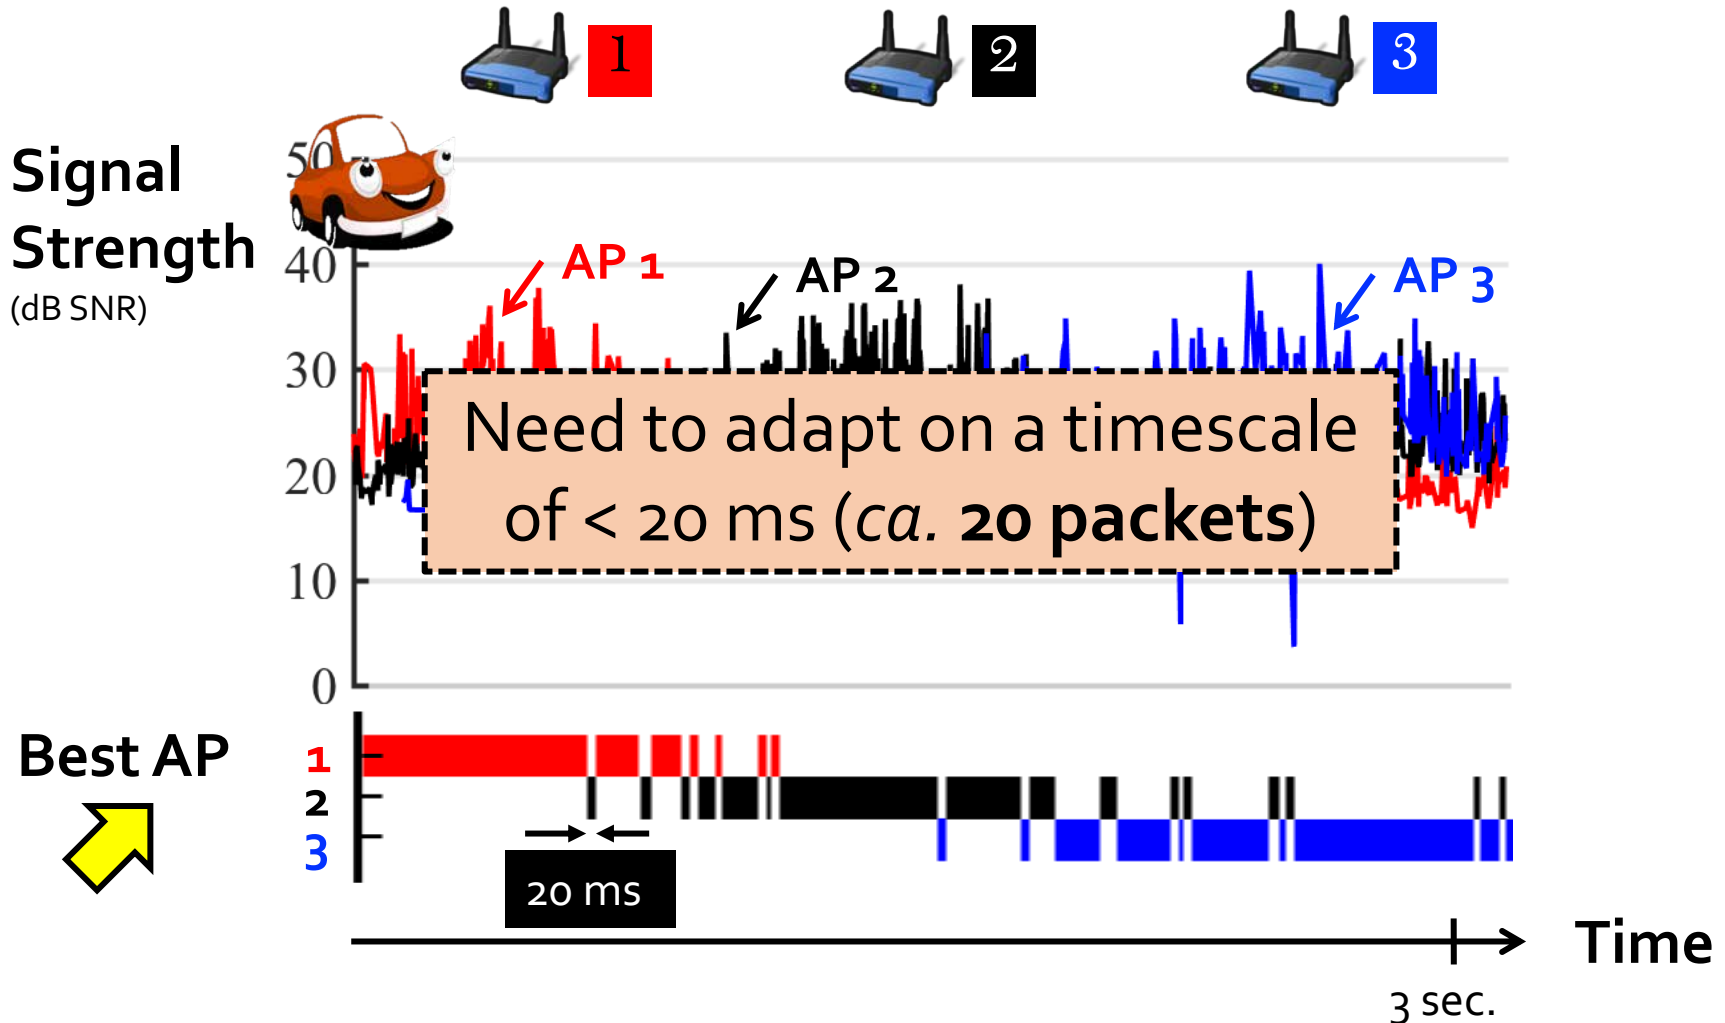

Downlink: Best to Choose one AP

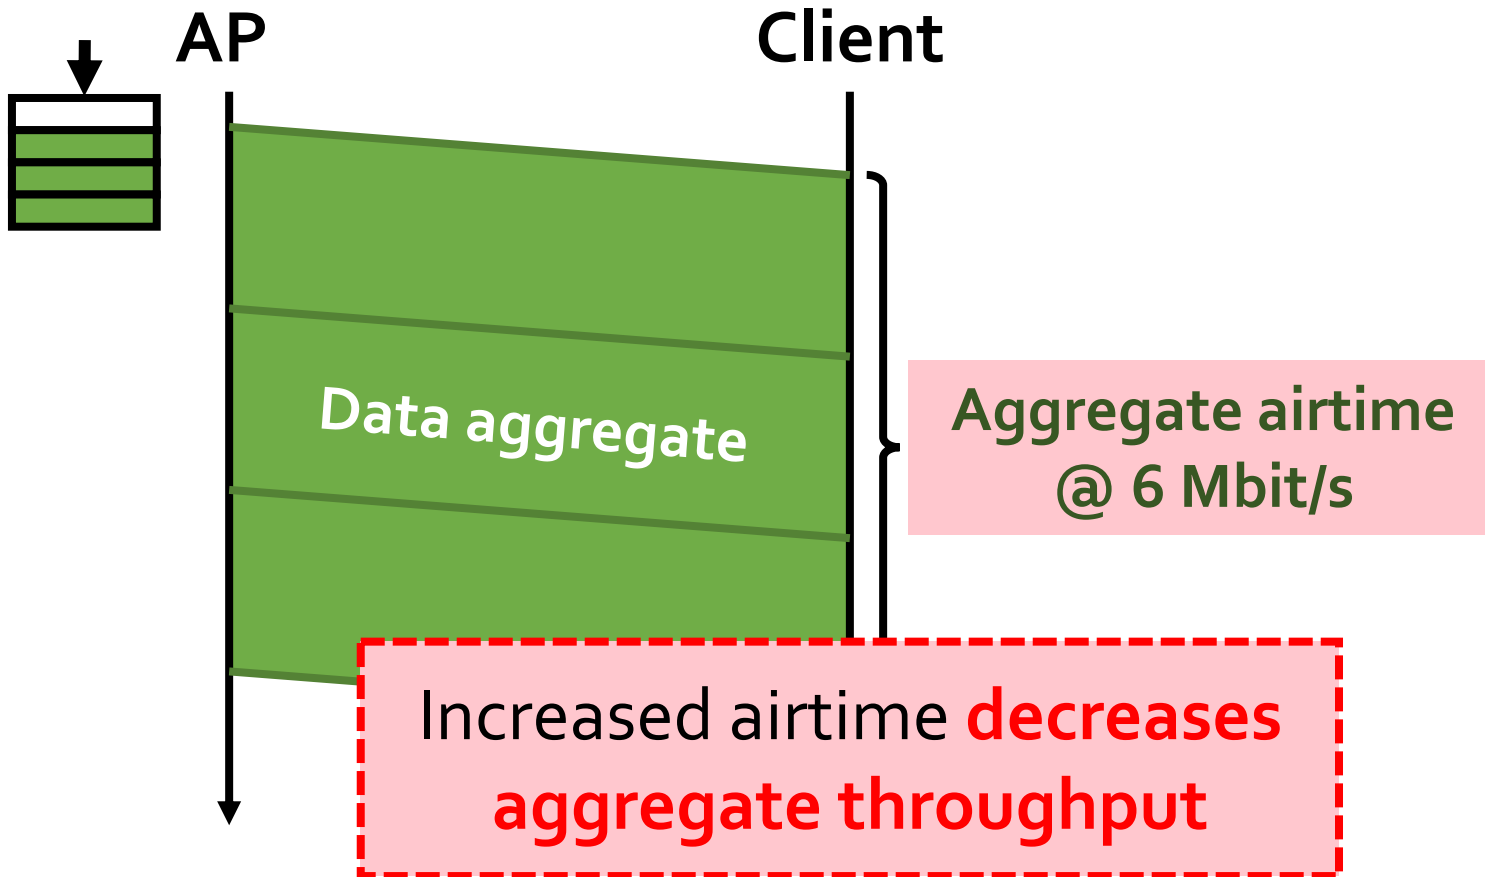

Challenges

1. The real wireless channel is **unpredictable**

Real wireless is unpredictable

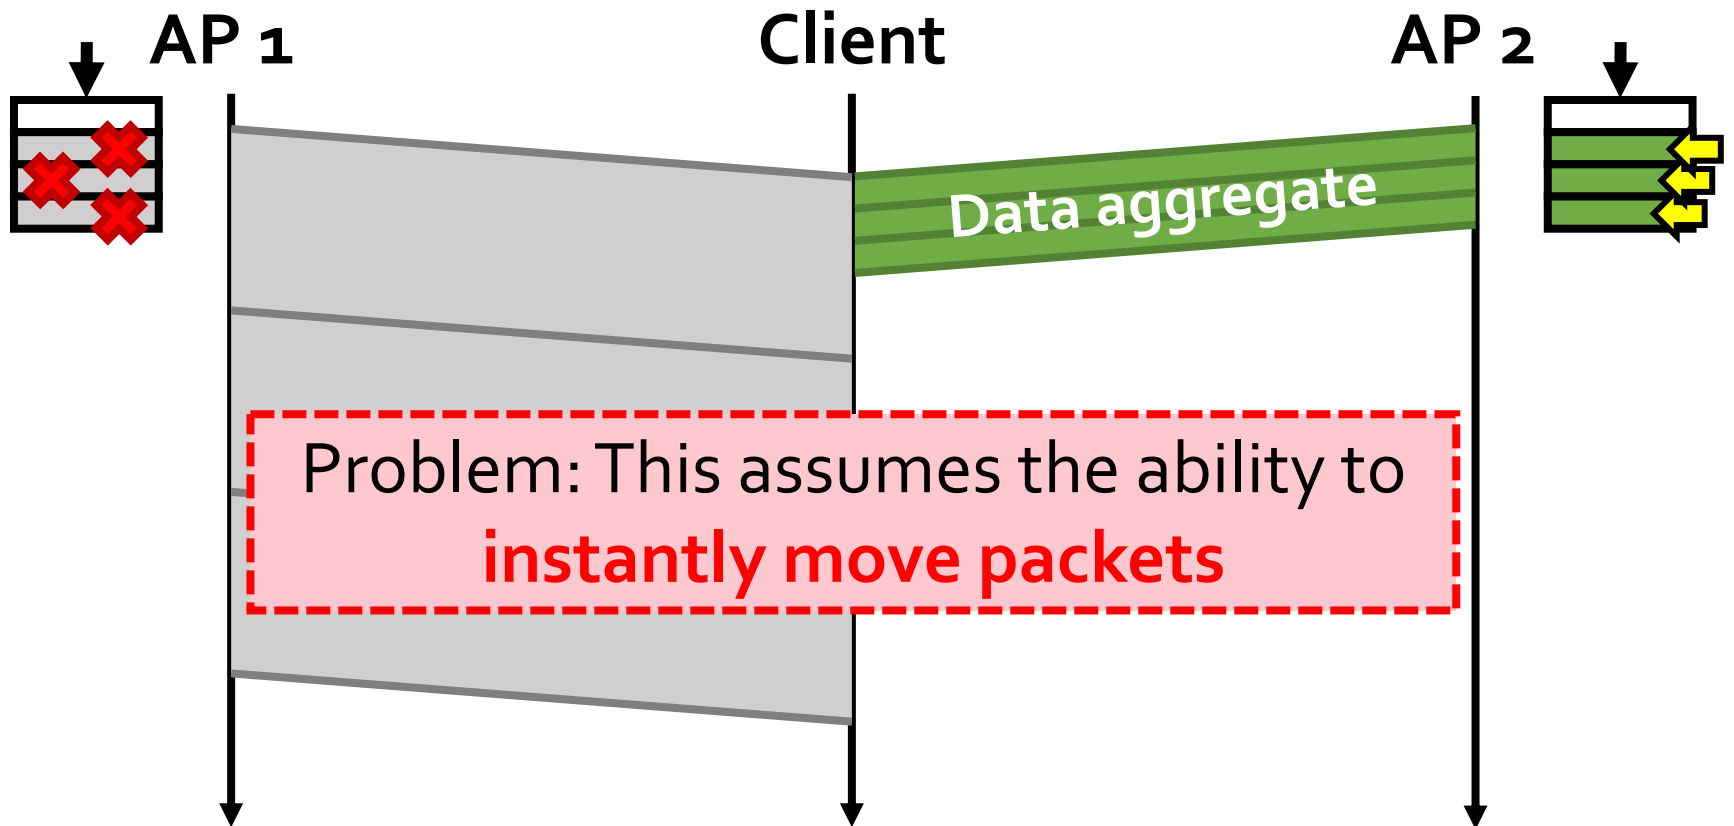

Channel degradation decreases efficiency

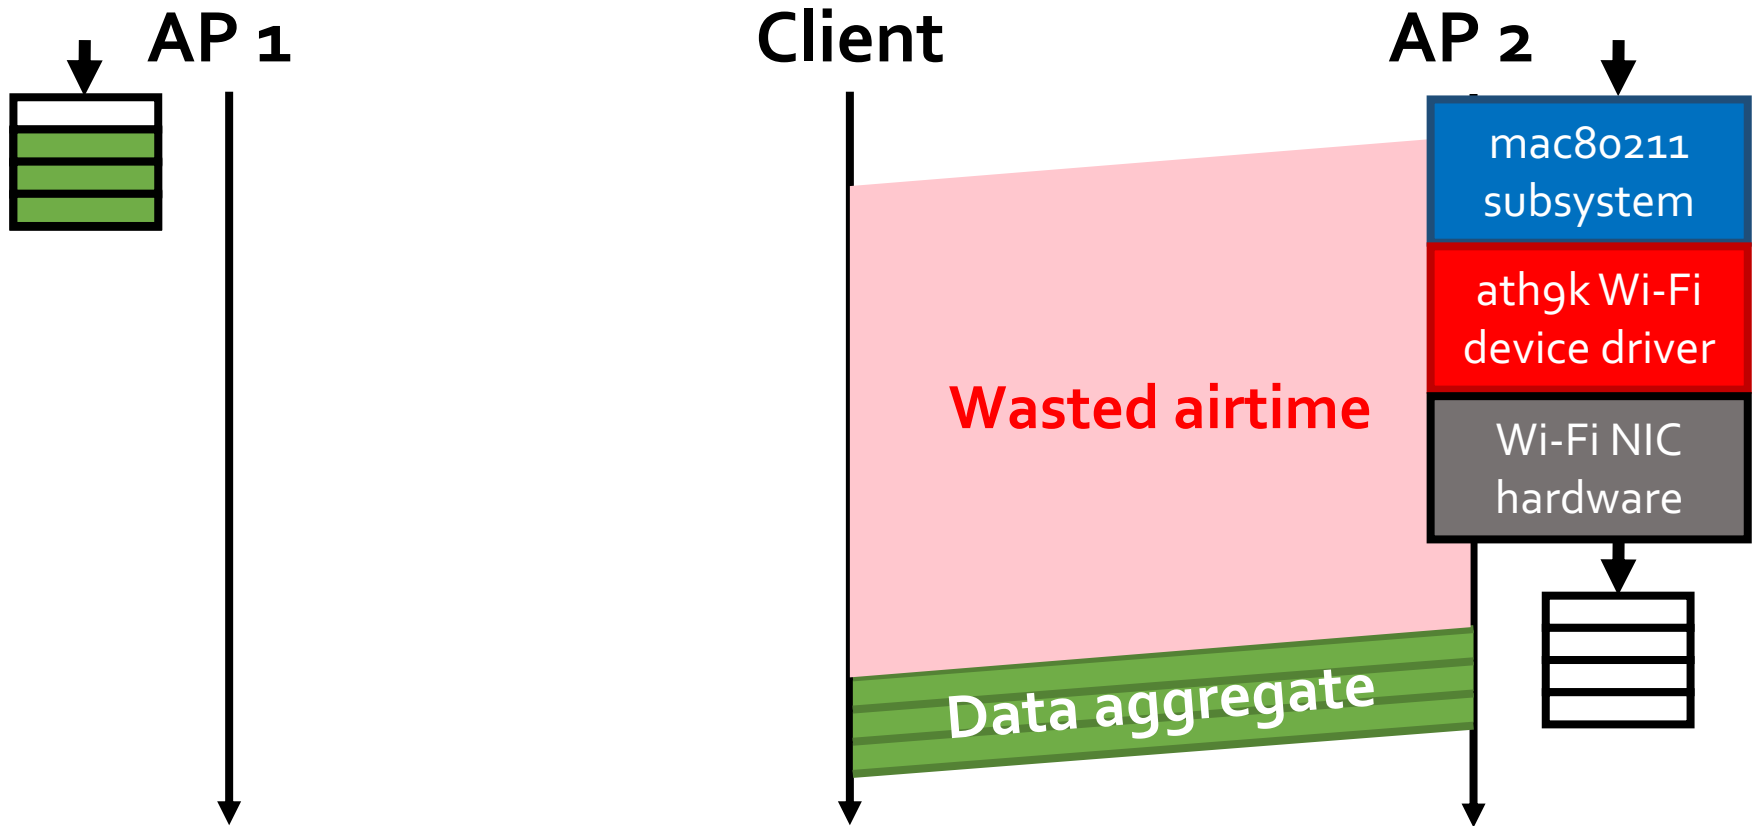

Challenges

1. The real wireless channel is **unpredictable**
2. **Packet buffering** inhibits rapid adaptation

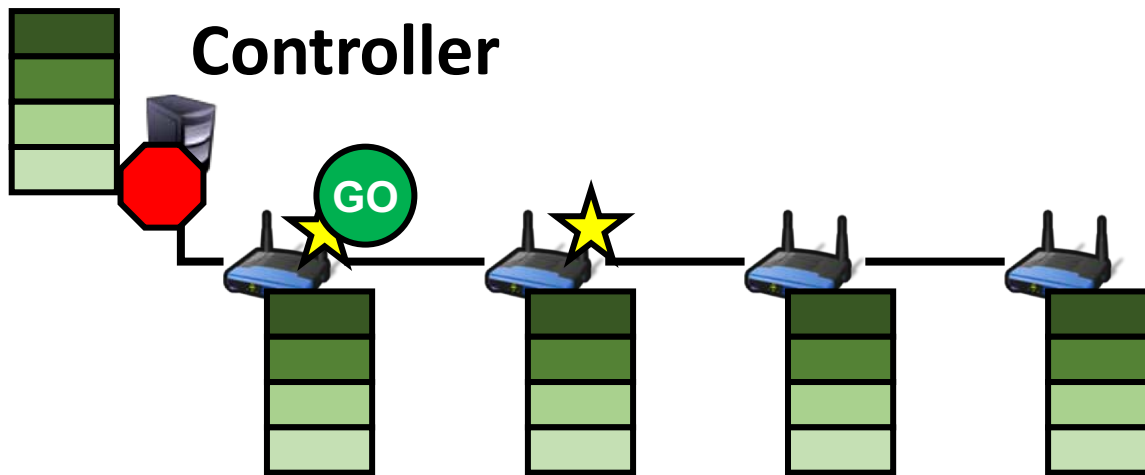

Possible solution: Move the packets

But moving packets harms throughput

Pre-buffering maintains high throughput

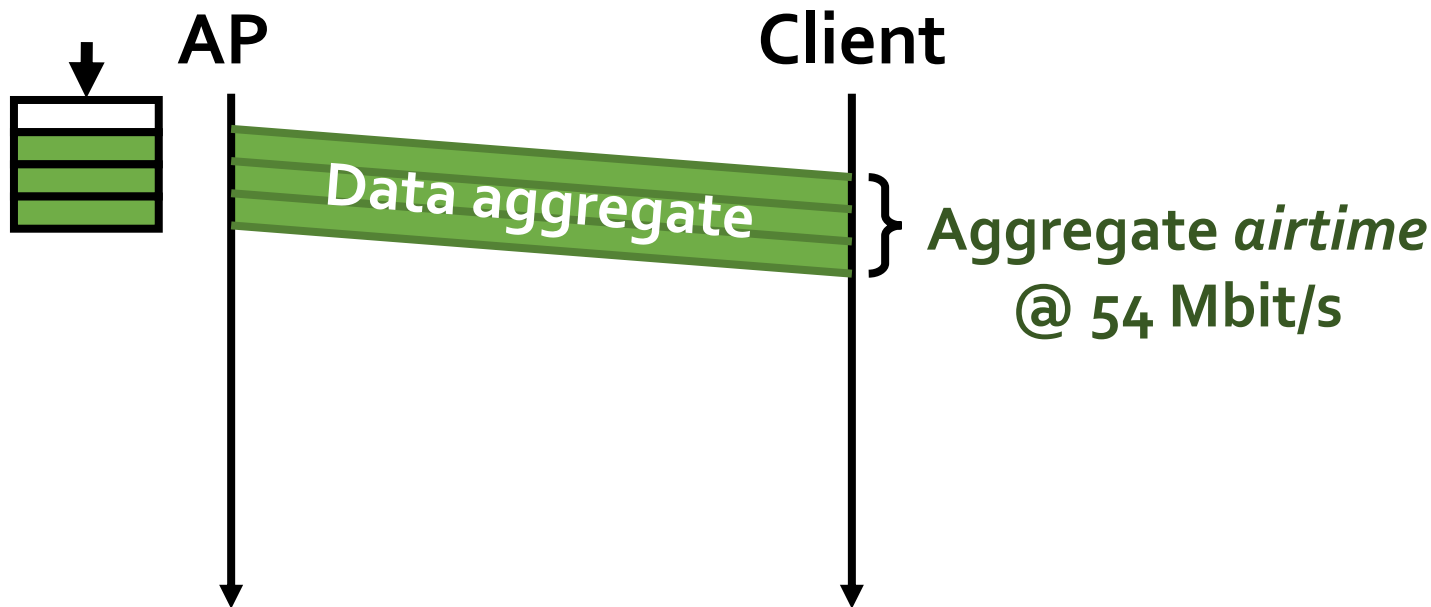

- All downlink packets sent to all APs
- *Control messages* **de-queue** delivered packets, **increasing efficiency**

Challenges

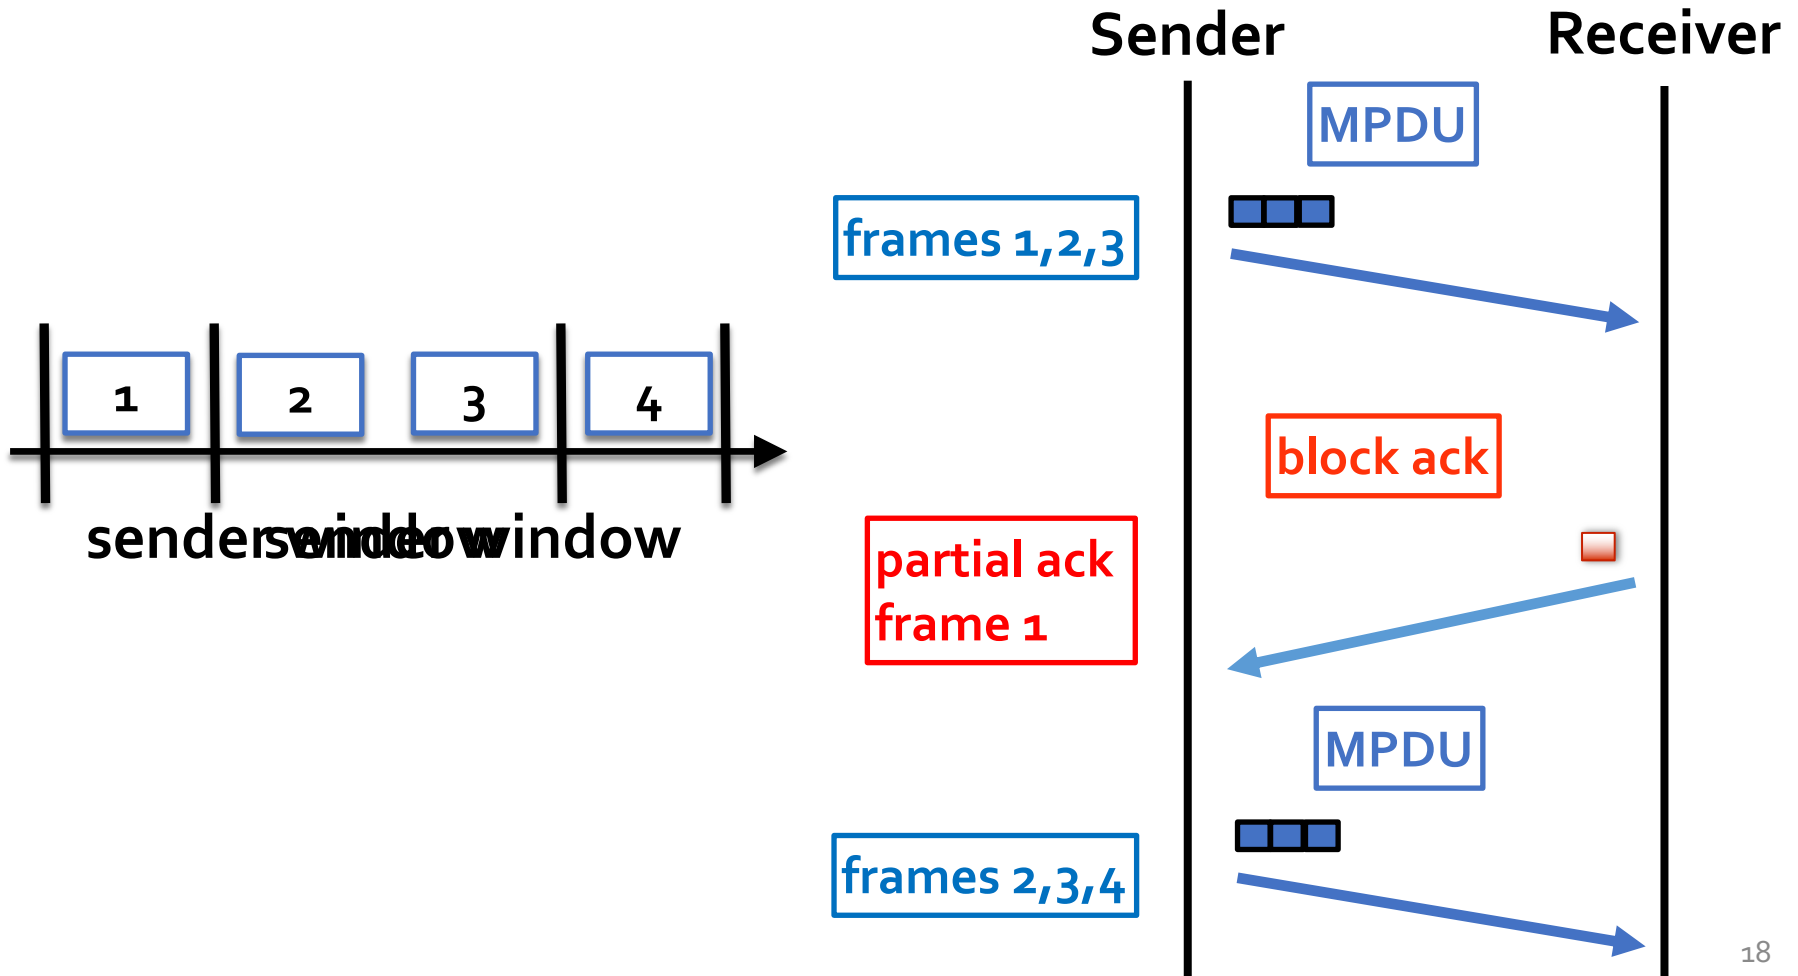

1. The real wireless channel is **unpredictable**
2. **Packet buffering** inhibits rapid adaptation
3. **Frame aggregation** complicates rapid adaptation

Wi-Fi frame aggregation

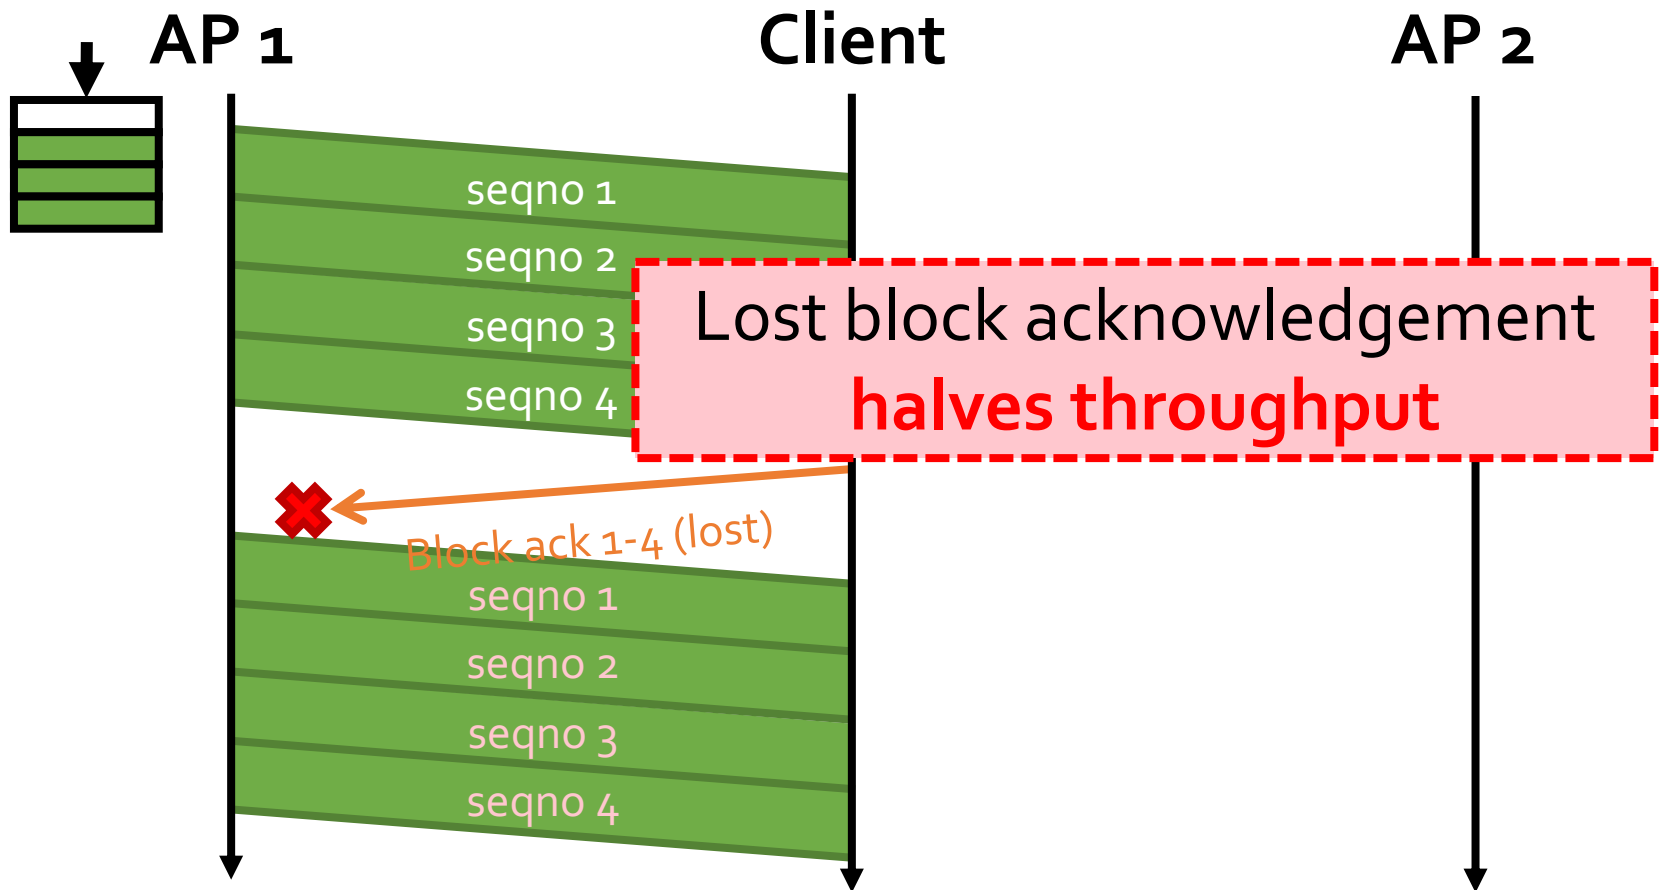

- Aggregates amortize the medium acquisition performance overhead

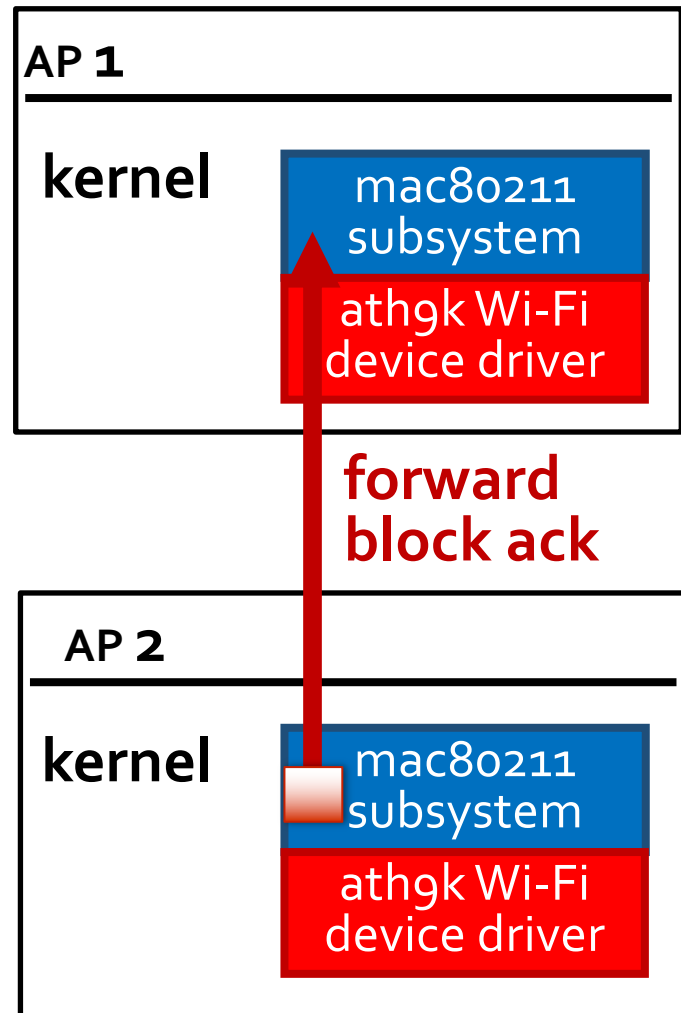

Wi-Fi frame aggregation and block acknowledgements

Problem: Lost block acknowledgements

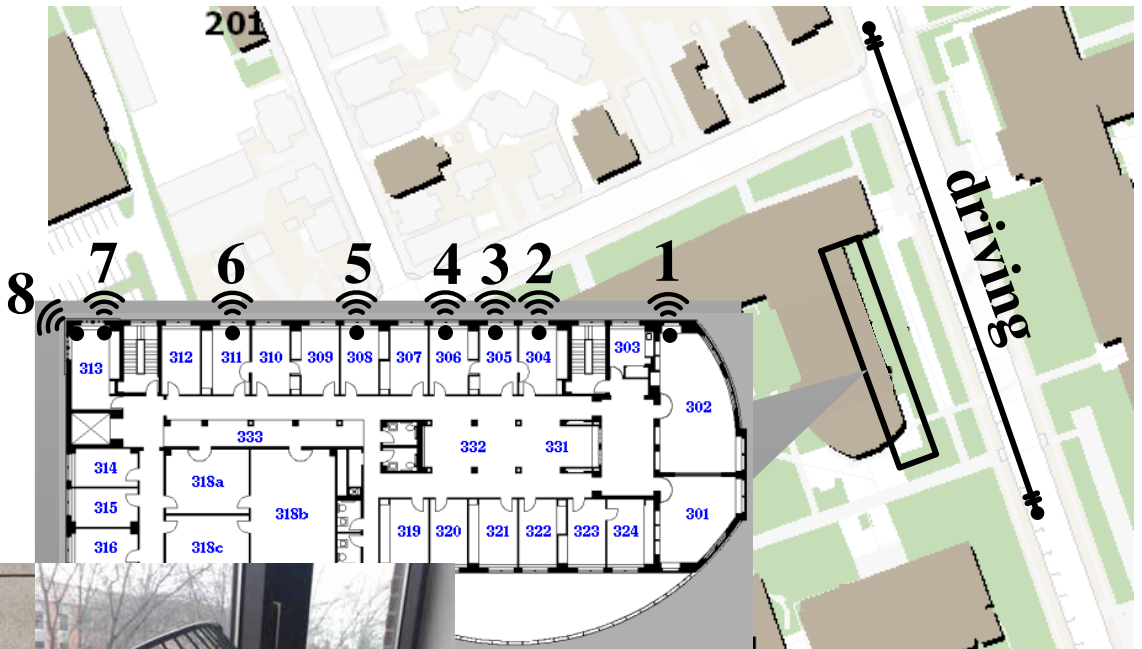

Solution: Block ACK forwarding

Implementation and a first testbed

- 8-AP roadside hotspot testbed at Princeton
- 25 mph car-driving experiments on road

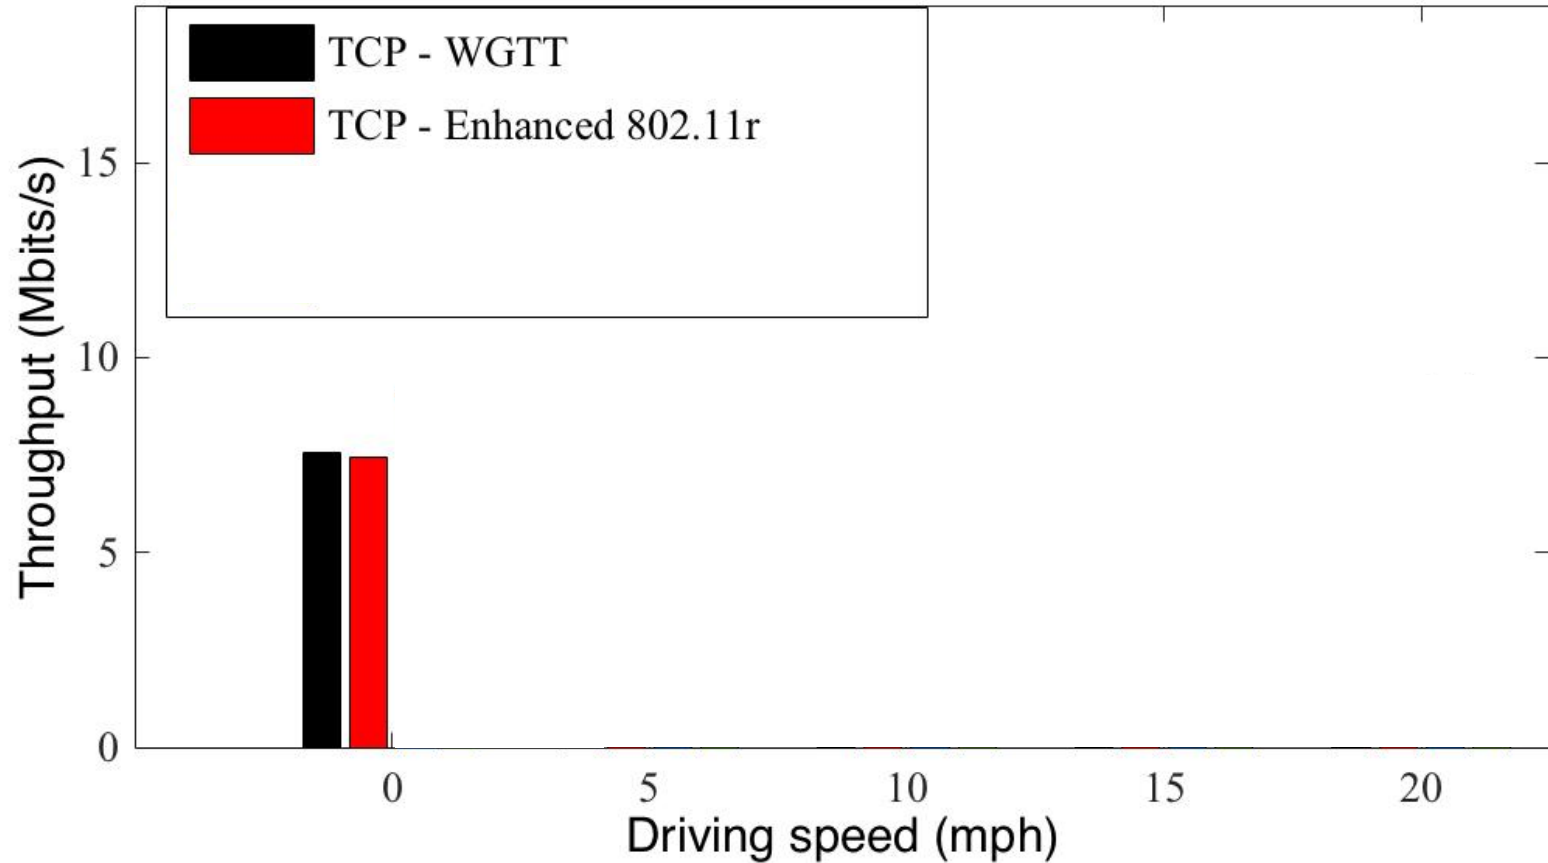

- Commodity Atheros Wi-Fi cards
- Directional antennas

Blue sign with white text and graphics, possibly a logo or advertisement.

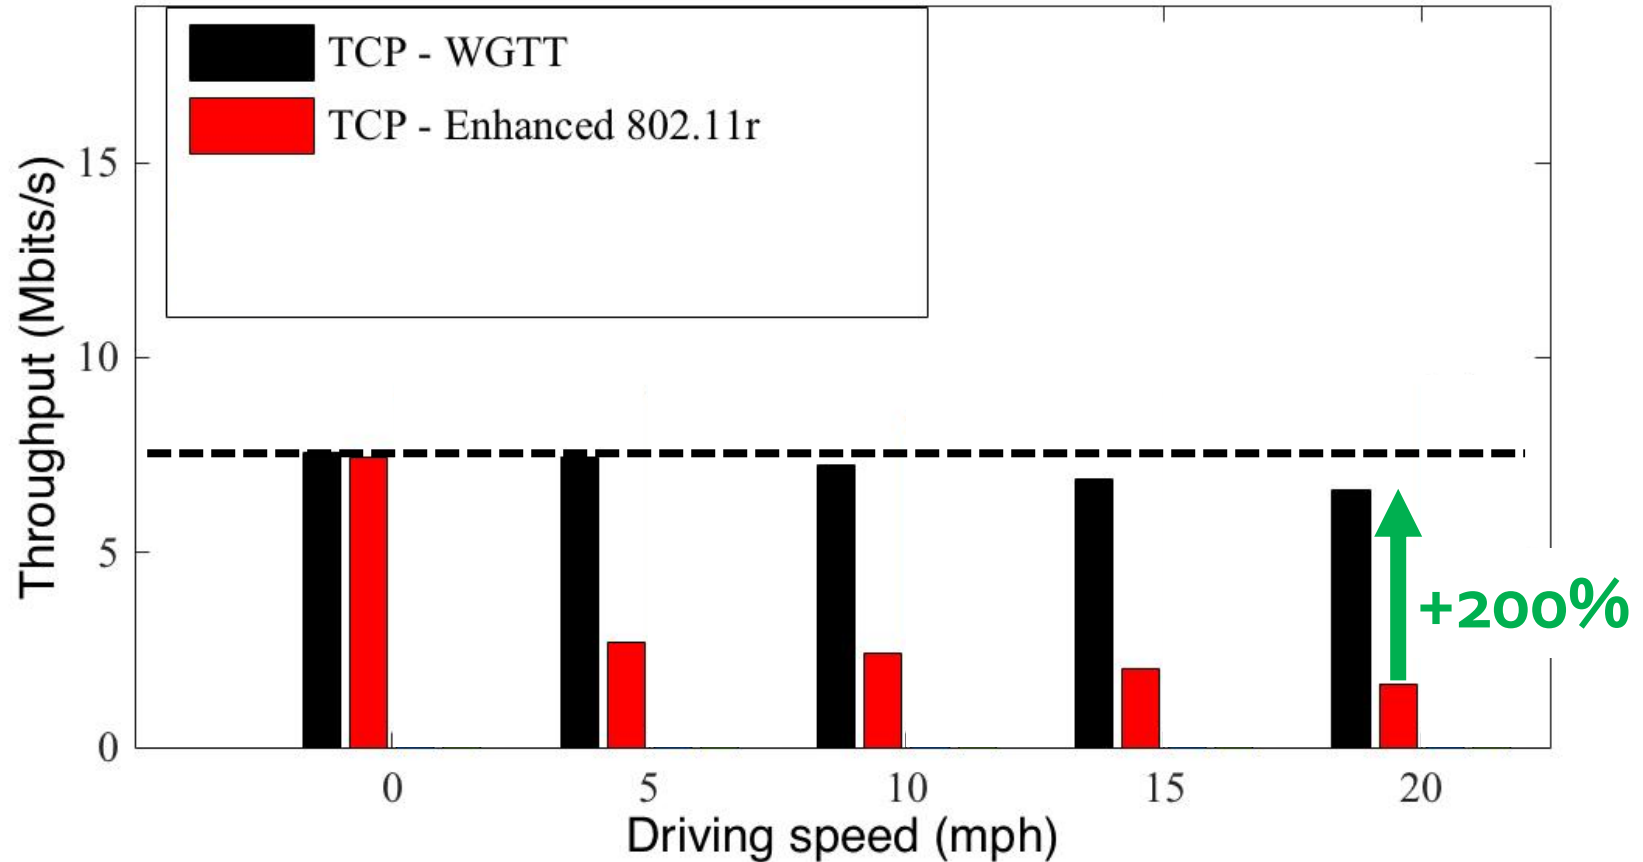

Wi-Fi works fine when stationary

But Wi-Fi can't handoff fast enough

Driving, WGTT maintains high throughput

Next steps

- Scale up AP counts, deploy alongside Princeton campus light rail line, and **campus roads**

- **Integration with eduroam** for automatic association

Thanks and further details

- Grateful for support from a **Google Research Award** and the **Princeton IP Accelerator Fund**
- Further details: see **SIGCOMM 2017 paper**
- **Papers and videos** available for public download at the Princeton PAWS group website:
